

I have developed the web page for the Doctors interface .

When the doctor logs in to the Webpage he can see his Patient Records, Scheduled operation by Date ,Patient Report, insurance Claims record of patients. He can also add a new record.

- 1. Patient's snap: This has the data of the patient which he had consulted with the Patient ID.
- 2. Operations: This has the record of the Operations which he is going to perform and has details like Operation date , operation Room, type of operation he is going to perform . This data is collected from the Patient DB and the Doctor DB.
- 3.Reports: This has the record of the patient assisted by the Nurse like the name of nurse, type of Operation, assisted Doctor and the Department. This data is collected from the Nurse DB, Department DB and Doctor DB.
- 4. Insurance : This has the Record of the Insurance claim by the Patient , Insurance company name, and the total amount of operation . This data is collected from the Patient DB, Claim DB , and the Insurance Company DB.
- 5. New Record: If the Doctor wants to add a new patient record he can press that button and add a patient record manually . This data is stored in the Patient DB and Operation DB.

The Below is the normalized ERD diagram of the MY_Hospital_DB for the Flow reference.
